"Observations Concerning Intradermal Injections of Novocain in Angina Pectoris."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 24, 10 Jun 63, pp 855-857

Abstract: [Authors' English summary modified] Authors employed intradermal injection of novocain for the treatment of cardiac asthma, with observations lasting 3 mos-3.5 years. Patients with history of myocardial infarction and coronary pains showed improvement, and the retrosternal pains disappeared. Treatment was ineffective for cases with cardiac neurosis. Authors recommend this treatment for cardiac pains, where other methods are ineffective. There are eight (8) references, containing one (1) each Polish, German, and French, and five (5) Soviet sources.

TITLE: Determination of nickel film thickness on nickel-clad steel strip

SOURCE: Hutnik, no. 1, 1967, 10-15

TOPIC TAGS: nickel film, nickel plating, nickel plate, nickel, nickel-clad steel strip, thin nickel film

ABSTRACT: The electronic industry requires a uniform 10-micron thickness of the nickel film on 0.15-mm carbon steel strip nickel-clad on both sides. Studies at the Baildon Steel Works for developing a method to measure such films accurately, undertaken in cooperation with the Chair of Metallurgy and Heat Treatment, Academy of Mining and Metallurgy, were concluded in 1965. The film thickness was determined by the "jet-time," microscope, and chemical methods on microsections of

TITLE: The Distribution of Rare Earths in Minerals of the Pegmatites of Northwest and Southwest Karelia (Raspredeleniya redkikh zemel' v mineralakh pegmatitov Severo-zapadnoy i Yugo-zapadnoy Karelii)

PERIODICAL: Geokhimiya, 1959, Nr 2, pp 140-144 (USSR)

ABSTRACT: The author lists 6 analyses of the rare-earth content of minerals from Northwest Karelia, which were carried out by R. L. Barinskiy, and compares them with 5 analyses of minerals from Southwest Karelia mentioned by Sahama and Vähätalo (Ref 5). Furthermore, the content of cerium- (La, Ce, Pr, Nd, Sm, Eu) and yttrium-group elements (Gd, Tb, Dy, Ho, Er, Tu, Yb, Lu, Y) is shown in a diagram. The investigation shows that elements of the cerium group accumulate in the early stages of pegmatite formation, elements of the yttrium group in the later stages. - Due to the effect of late solutions on selective yttrium minerals "secondary" minerals form metasomatically which contain comparatively lower percentages of elements of the yttrium group. This may be explained by the greater mobility of yttrium earths in more basic solutions. There are 1 figure, 1 table,

Grozny. Naftyanoy nauchno-issledovatel'skiy institut

Khimiya i tekhnologiya pererabotki nefti i gaza (Chemistry and Technology of Petroleum and Gas Refining Processes). Moscow, Gosgoptekhnizdat, 1959. 278 p. (Series: Its: Trudy, vyp. 4) 2,500 copies printed.

Executive Ed.: T.D. Yefremov, Tech. Ed.: A.J. Polosina, Editorial Board: A.Z. Dorogochinskiy (Chairman), B.K. Amerik, G.I. Kaz'min, E.M. Kuz'min, V.I. Lavrent'yev, Ye.B. Lavchenko, and M.G. Mitrofanov (Deputy Chairman).

PURPOSE: This book is intended for petroleum engineers and technicians in scientific research institutes, planning organizations, and refineries.

COVERAGE: This collection of technical papers on oil and gas refining were originally discussed at the petroleum refining section of the Third Grozny Scientific-Technical Congress in 1957. The articles have been published to help further the development of the petroleum refining industry and petrochemical industry in the Chechen-Ingush

quarry in the Grozny region is outlined by A.Z. Dorogochinskiy with emphasis on the interdependence of the refineries and the aircraft, automobile and rocket manufacturing industries. Change in modern engines demand a change in fuel and lubricating oil properties. The increased use of jet aircraft meant the production of high octane aviation gasoline. Since the yield of which requires a quite different refinery run. Since crude oil recovered at the Grozny field is characterized by a high content of paraffin, the material for manufacturing lubricating oil and paraffin wax, their properties have been thoroughly investigated and results of analyses reviewed. The re-equipment of the fuel producing line of refineries at Grozny has been carried out on the basis of findings obtained from tests and pilot plant operations, and a number of reforming and platforming units have been built to upgrade the low octane gasoline produced at Grozny. Tests were also conducted to ascertain the advisability of applying the destructive distillation of residues, which had been badly needed for catalytic cracking, to the feed stock. Catalytic cracking units of the 3-102 type were first put on stream in the

Grozny refineries in 1952, and since that time continuous efforts have been made to boost their processing capacity, and improve the regeneration of catalysts. The authors also discuss the regeneration of catalysts. The production of different types of catalysts and catalysts, the contamination of catalysts and their reactivation are discussed. The operation of a contact coking reactor, its design, and products yielded by contact coking units are described. The authors also deal with the manufacture of lubricating oils, paraffin and ceresine wax and indicate way of improving their properties. Electrical dehydration and desalting of crude oil and of light products are discussed. The authors state that in recent years extensive studies were made on the chemical conversion of petroleum products, and particularly of gasolines, into numerous products, and acetone, propylene and benzene, to synthesize ethyl alcohol and oxides paraffinic hydrocarbons. An article is devoted to problems of automating various processes and developing the related control and gauge instruments. The book contains numerous tables with the characteristics of different petroleum products obtained from refinery processing units, pilot plants and petrochemical refinery sections. Each article is accompanied by references.

Title : ~~Lightning disturbances in oil-field power distribution system of 6 to 0.4 kv.~~

Periodical : Energ. byul. 12, 13-16, D 1955

Abstract : The author brings out the fact that up to 24% of all failures in oil field power lines, including those of 35 to 110 kv, occur in electric power circuits of 6 to 0.4 kv. He describes and tabulates the usual damages in electric power transmission lines since 1948 up to present (8 mos ~~of~~ 1955). He points out that there are no instructions for protection of lines below 3 kv, and that such preventive regulations should be issued as soon as possible. The scientific research institutions should develop adequate measures to safeguard installations in the 6 to 0.4 kv networks. Four graphs, 1 table, 4 Russian references, 1950-55.

TITLE: A New Method of Denitration of Acid

PERIODICAL: Koks i khimiya, 1959, Nr 7, pp 53-54 (USSR)

ABSTRACT: A method of denitrating sulphuric acid before it is used for the production of ammonia sulphate is proposed. It consists of an addition to the acid of 0.1 - 0.3% of heavy benzole containing a considerable proportion of unsaturated compounds. The mixture is intensively stirred for one hour by blowing air. A complete denitration of the acid takes place. The method was tested under industrial conditions with satisfactory results.

TITLE: Non-Ionogenic Surface-Active Substances 1 ~
De-Emulsifying Agents for Petroleum Emulsions

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1960, No.4,
pp.24-29

TEXT: Results of synthesis and testing of non-ionogenic surface-active substances (de-emulsifying agents) from fractions of alkylphenols, obtained as a by-product in the production of an antioxidant additive 2,6-ditertiarybutylparacresol (DBPK) are given. As a starting material for the synthesis monoalkylcresol fraction (126 to 142°C at 20 mm Hg) and residue from the production of DBPK and their mixtures and oxyethylene were taken. The experimental procedure is described in some detail. Specimens of alkylene glycols obtained were tested on petroleum emulsions as de-emulsifying agents and surface tensions of their aqueous solutions of various concentrations were tested (Fig.1). By varying the duration of oxyethylation process products containing various numbers of oxyethylene groups were obtained. It was found

TITLE: Clearance Between Piston and Cylinder and the Permissible Disalignment of a Piston in a Compressor Cylinder

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 3, pp 37 - 40 (USSR)

ABSTRACT: The article deals with the calculation of clearances between piston and cylinder. On the size of the minimum clearance depends the tolerance of disalignment of the piston in the cylinder. The author considers two kinds of clearances: operational and constructional. The minimum operational clearance can be taken as corresponding with the hydrodynamic theory of lubrication. The constructional clearance depends on the material and the working temperature of the piston and can be determined on the basis of the operational clearance, the conditions of the thermal expansion of adjacent parts, and also the phenomenon described as "cast iron growth". The author proposes some formulae based on experimental and theoretical studies for the calculation of these clearances and also of the permissible disalignment of the piston in the cylinder in the plane of the axis of the crankshaft; the tolerance in question is determined on the basis of the operational clearance and

Card 1/2

SOV/66-59-3-9/31

Clearance Between Piston and Cylinder and the Permissible Disalignment of a Piston in a Compressor Cylinder

the height of the piston. The article mentions Professor P. Berg /Ref 4/ who defined cast iron growth as an increase in volume by heating due to the material becoming more porous, as a result of graphite separation.

TITLE: Standards for Piston Compressors

PERIODICAL: Standartizatsiya, 1960, Nr 5, pp 20-21 (USSR)

ABSTRACT: The article deals with the necessity of revising piston compressor ³
standards ("GOST 7421-55" and "GOST 7475-55") since they are no
longer useful in the production of single-block compressors such
as those of the unified compressor type developed from the AU-200
model. In particular, the standards give no specifications on the
permissible deviation in the reciprocal position of compressor
parts. Precision tests carried out by the Zavod "Kompessor" ("Kom-
pressor" Plant), Moskva and Melitopol, and the Zavod kholodil'nogo
oborudovaniya imeni Stalina (Refrigerating Equipment Plant imeni
Stalin), Odessa, showed that it is extremely difficult to keep to
the deviation dimensions. This operation results in additional
fitting work which amounts to 20-25% of the total work. The lack
of precise standard specifications mostly affects either the
piston's or crosshead's curving, with early wear of the cylinder's
